

I'm nearing completion of the Springboard.com Data Science curriculum. My capstone projects involve using regression models to predict 2021 US Life Expectancy at Birth and WalMart Weekly Sales. My engineering background, previous project management experience, and python/jupyter notebook skills would be useful in working with teammates/clients to make objective decisions. In my previous employment as an engineering technician for an indoor agriculture startup, I helped construct and operate an automated plant growing facility. Witnessing machine learning firsthand coupled with longtime interests in building gadgets and craps, inspired my ambition to become a data analyst.
